

Exercise 1:

Get comfortable with AI and ask it questions:

Explain how a car engine works like I'm 10 years old

Does it sound accurate? Yes

EXERCISE 2:

No, it isn't accurate, it doesn't sound like me. It just made it up.

prompt → **output** → **feedback** → **iterate** loop

EXERCISE 3: ASK AI SOMETHING IT CAN'T ANSWER

LAB EXERCISE 4: THE PREDICTION GAME

Part A- Finish the sentence:

- Did AI's answer match yours? Why or why not?

No the AI's Answer did not match my answers. It was just making it up as it went along predicting what I was going to say. Assuming but it was wrong.

- Run prompt #1 three times. Did you get the same answer each time?

No the answer was different each time. It tells me that AI is creating word selection, and predicting word selection to complete the sentence.

- What does this tell you about how AI works?

It tells me that AI is probabilistic. Predicting word selection to complete the sentence.

Part B-Break it on purpose:

What is my dog's name? I don't know your dog's name unless you tell me, and you haven't shared it here.

I can't get AI to give me a wrong answer, however, the last time I asked Google AI to help me with isPalindrome question, and I ran it, it was wrong. I couldn't get it to generate the true and false. Chat GPT got it right twice with a function and a for loop.

Lab Exercise 5: AI Can CODE:

Write a simple HTML page that says "Hello, World!" in big blue text, centered on the page, with a light gray background.

Questions:

- Did it work? What do you see?

Yes, it worked. I see Hello, World! In big blue text centered on the page with a grey background.

- Look at the code. Can you find where it says "Hello, World!"?

Yes

- Can you find where the color blue is set?

Yes in HTML, but when I entered a second line, it was centered next to the word because AI predicted I wanted the body centered not the text.
